Abstract:
Despite the limitations of organ availability and a small risk to living donors, liver transplant is being proposed as the treatment of choice for liver cancer as the technique and outcomes have allegedly improved. But what does the data say? Is there sufficient evidence? A systematic review was conducted to ascertain the reality.

Biography:
Fahad Siddiqui is an epidemiologist. Being a member of Singapore Branch of Australasian Cochrane Center currently he is involved in a number of systematic reviews. He has written a book chapter on Hepatocellular Carcinoma in Eastern Asia besides several publications.

His other research work includes outbreak investigation of two Shigella outbreaks, and establishing surveillance system of febrile illness, including Dengue Fever, in a community setting.

He has researched chronic diseases in south Asian countries and developed first cardiothoracic surgery database in a tertiary care hospital in Pakistan.

He facilitates Cochrane Systematic Review Workshops and is a faculty member of Asia-Pacific Evidence-based medicine and nursing group.
